Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	31 January 2026
Team ID	[Add Team ID]
Project Name	Global Fuel Prices & Taxation Analysis Dashboard
Maximum Marks	4 Marks

Functional Requirements:
Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)	Priority (High/Medium/Low)
1	Data Access & Integration	Load the global fuel prices CSV (27,468 weekly records, 84 countries, 7 regions, Jan 2020 to Apr 2026) into Tableau as the data source.	High
2	Data Processing	Check the date field and missing values, and create calculated fields: Subsidy Score, Avg Fuel Price and Diesel Volatility.	High
3	Business Analysis	Calculate average tax, average fuel prices, subsidy-level comparisons, diesel volatility (standard deviation divided by mean) and diesel price forecasts by region, country, year and income level.	High
4	Business Insights & Analytical Outputs	Provide nine visualisations on one dashboard: tax map, tax vs subsidy grid, subsidy vs price, diesel trend with forecast, top/bottom 10 markets, volatility heat map, tax by income, subsidy mix by income, and prices by fuel type and income.	High
5	User Interaction & Analysis	Let users filter by year and region, click a chart to filter the others, and use tooltips to explore details.	Medium
6	Data Update & Reporting	Update by reloading a newer CSV, then publish to Tableau Public and share through a project website and GitHub repository.	Medium

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The dashboard has three scenario sections with clear titles, consistent colours and labels, so non-technical stakeholders can read it without training.
NFR-2	**Security**	Only a public, non-personal dataset is used. The workbook is shared through Tableau Public and GitHub, so no confidential data is included.
NFR-3	**Reliability**	The same calculated fields and averaging rules are used across all charts, so results stay consistent and repeatable.
NFR-4	**Performance**	The dataset (27,468 rows) is small enough for Tableau to filter and redraw charts smoothly.
NFR-5	**Availability**	The published Tableau Public dashboard and the project website can be opened online at any time without installing software. A copy is kept in GitHub.
NFR-6	**Scalability**	More years, countries or fuel types can be added by loading a larger CSV with the same columns, without redesigning the charts.
